 Sequence 55, Application US/08927939;
Patent No. US2010006640A1
GENERAL INFORMATION:
APPLICANT: Grainger, David J.
APPLICANT: Tatalick, Lauen Marie
TITLE OF INVENTION: Compounds and methods to inhibit or
TITLE OF INVENTION: augment an inflammatory response.
FILE REPERENCE: 295.022US1
CURRENT APPLICATION NUMBER: US/08/927,939
CURRENT FILING DATE: 1997-09-11
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                               Search completed: February 16, 2003, 00:33:05 Job time : 376 secs

No. is the number of results predicted by chance to have a score greater than or equal to the score of the result being printed, and is derived by analysis of the total score distribution.
                                                                                                                                                                                                                                                                                                                                                                                         N Geneseq 101002:*

The sequence may be expressed from a plasmid transformed expression system and may be useful in the prevention of tissue damage alsociated with emphysema, adult respiratory distress syndrome, psoriasis and bullous dermatoses. Other treatable conditions

The present invention describes: (1) an elafain (EL) expression vector comprising a gene encoding EL and a gene encoding alcohol oxidase 1
                                                                                                                                                                                                                                                                                                                                                                                                                                                     61 CTAAGCCAGGTTCTTGTCCTATTATCTTGATTCGTTGCGCTATGTTAAACCCACCTAACC 120

controlling region (AOCR) which controls the expression of EL encoding gene; (2) a microbial host transformed with the vector; (3) DNA fragment for recombinant transformation comprising: (a) a first region homologous to the genomic DNA of the host; (b) a promoter region of (AOCR) gene; (c) a gene encoding signal peptide; (d) a linker designed to secrete a matured elafin; (e) a gene encoding EL; (f) selection marker gene; (g) stop codon, and (h) a second region homologous to a part of the genomic DNA of the host, and (4) a microbial host transformed with the DNA fragment of (3). The microbial hosts can be used to prepare EL commercially. The production of EL by the microbial hosts can be carried

The DN encoding wild type elafin is mutated, inserted into a suitable vector and then used to transform E. coli, yeast, Bacillus subtilis or animal cells. The modified elafin is expressed when the transformed cells are cultured. The modified elafin are drugs with elastase inhibitor activity. They have improved oxidation stability over natural elafin and thus retain activity better under oxidative
                                                                                                                                                                                                                                                                                                                                                                  GCTCAAGAACCAGTTAAAAGGTCCTGTGTCTACTAAGCCAGGTTCTTGTCCTATTATCTTG 89

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                             The sequences given in AAQ56674-76 encode elafin derivatives. The DP encoding wild type elafin is mutated, inserted into a suitable vector and then used to transform E. coli, yeast, Bacillus subtilis transformed cells. The modified elafin is expressed when the transformed cells are cultured. The modified elafin are drugs with elastase inhibitor activity. They have improved oxidation stability cover natural elafin and thus retain activity better under oxidative conditions.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                        Gaps

The polymucleotides and encoded polypeptides are useful in pharmaceutical compositions, such as vaccines, for the diagnosis, prevention, and treatment of colon cancer. Polymucleotide sequences may be used as hybridisation probes or primers, and in the design and preparation of ribozyme molecules for inhibiting expression of tumour polypeptides and proteins in tumour cells. The compositions are useful for stimulating an immune response against cancer, particularly for the immunotherapy of colon cancer, and as markers for the progression of cancer.

ABK4450-ABK46237 represent coding sequences of human colon tumour
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                    The invention relates to polynucleotides encoding colon tumour proteins
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                       Force: With the exception of SEQ ID No 1 and 2, the sequence data for this patent did not form part of the printed specification but was supplied by the European Patent Office.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                        colon cancer polypeptides and polynucleotides, useful as vaccines, diagnosing, preventing, and treating colon cancer, and as markers the progression of cancer -

These tumours are often not diagnosed until they have spread, and, of those who survive, most must endure alterations in fearial and neck appearance as well as changes in speech, sight, smell, cheving, swallowing and taste perception. The coding sequences given, and the proteins they encode, car be used in the diagnosis, treatment and vaccination against cancer, particularly papillary and follicular carcinomas, papillary tumours, follicular adenoma, parathyroid hyperplasia, parotid cancer, lip cancer, squamous cell cancer of the tongue, oral tongue cancers and larynx

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                              Gene product has inhibitory activity against human leukocyte elastase (HLE) and may be isolated from psoriatic scales. The sequence may be expressed from a plasmid transformed expression system and may be useful in the prevention of tissue dange associated with emphysema, adult respiratory distress syndrome, psoriasis and bullous dermatoses. Other treatable conditions include atherosclerosis, cystic fibrosis, bronchitis and acute non-lymphoblastic leukkaemia.

Abs raised to the polypeptide may be used in detection.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                     Human leucocyte elastase inhibitor - is genetically engineered polypeptide for treatment of inflammatory, pulmonary and skin conditions
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                          60.5%; Score 124.6; DB 11; Length 504;

AB056306 to AB060787 represent isolated nucleic acids (I) differentially expressed in cancer tissues. ABB78993 to ABB79004 represent proteins encoded by the AB060776 to AB060787 uncleic acid sequences. (I) can be used in antisense therapy. An antibody immunoreactive with a polypeptide encoded by (I) is useful for detecting cancer in a patient sample, and conference or absence of a polynucleotide encoded by a nucleic acid which hybridises to (I) in a cell. A probe/primer derived from (I) can be used for determining the presence of a nucleic acid which hybridises to (I), in a cell. A probe/primer derived from (I) can be used for determining the phenotype of cells in a sample of cells from a patient. (I) is useful for determining the presence of colon cancer in a cell or tissue type, for determining the presence or state of other type of cancer, in antissnse therapy, to generate

The corresponding gene resides, and in tissue profiling, forensics, genetic analysis, mapping and disgnafest applications. (I) can be used to raise
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                        .

The DN encoding wild type elafin is mucated, inserted into a sustable vector and then used to transform E. coli, yeast, Bacillus subtilis or animal cells. The modified elafin is expressed when the transformed cells are cultured. The modified elafin are drugs with elasstase inhibitor activity. They have improved oxidation stability cover natural elafin and thus retain activity better under oxidative conditions.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                 Gaps

RESULT 10 ABK83819 ID ABK8 XX

```
The invention relates to detecting (MI) granulocyte (GC) activation (CGCA), by detecting the level of expression of gene (5) (GS) identified by DNA chip analysis as given in the specification, and comparing the expression level to an expression level in an unactivated (GC, where differential expression of GS is indicative of GCA. That alters the expression of at least one gene in GS; (2) screening (MI) can agent capable of modulating GN2 by contracting GC with an agent capable of modulating GCA or an inflammation (especially contract) in a tissue, an allergic response in a subject, exposure of a subject to a pathogen or sterile inflammatory disease using the control of in a tissue, an allergic response in a subject, exposure of a subject to a pathogen or sterile inflammatory disease using the control of inflammatory disease, by detecting the subject to a pathogen or sterile inflammatory disease, by detecting the subject to a pathogen or sterile inflammatory disease, by contacting a tissue, an allergic response in a subject, exposure of a subject to a pathogen or sterile inflammatory disease, an allergic response in a subject, exposure of a subject to a pathogen or sterile inflammatory disease, and a tissue having or sterile inflammatory disease, and a tissue having a subject, exposure of a subject to a pathogen or sterile inflammatory disease, and is useful for screening an agent that modulates the expression of gene (S) for modulating GA, MI is useful for screening an agent capable of modulating an inflammation (sepecially chronic) in a tissue, an allergic response in a subject, exposure of a subject to a pathogen or sterile computation of sepecially chronic) in a tissue, an allergic response in a subject, exposure of a subject to a pathogen or sterile computation injury, ARDS, adult respiratory distress syndrome, continity and disease, also bacterial enfection, protozoal infection, viral infection, indicating continuous distress syndrome, continuous disease, also bacterial enfecting for treating one of the ab
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                            Detecting granulocyte activation by detecting differential expression
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                 of genes associated with granulocyte activation, which serves as diagnostic markers that is useful for monitoring disease states and

The present invention describes a method (M1) for screening for anti-neoplastic agent. The method involves exposing cells to a chemical agent to be tested for anti-neoplastic activity, determining a change in expression of at least one gene (I) of a signature gene set, where (I) comprises a sequence (S) selected from 847 sequences (given in ABL61664 to ABL7010), or is at least 95% identical to (S), where a change in expression is indicative of anti-neoplastic activity. (I) has gyrostatic activity and can be used in gene therapy. MI can be used for screening an anti-neoplastic agent, and can be used for producing a product which is the data collected with respect to the anti-neoplastic agent as a result of MI, and the data is sufficient to convey the chemical structure and/or properties of the agent. MI can be used in the treatment of cancer such as colon, breast, stomach, lung, thyroid,
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                               oesophageal, ovarian, kidney, prostate or pancreatic cancer, adenocarcinoma, carcinoma, clear cell cancer, infiltrating ductal cancer, infiltrating lobular cancer, squamous cell carcinoma, neuroendocrine

Screening for anti-neoplastic agent involves exposing cells to a chemical agent to be tested for anti-neoplastic activity, and determining a change in expression of a gene of a signature gene set

Claim 1; SEQ ID 4825; 44pp; English.

The present invention describes a method (M1) for screening for an anti-neoplastic agent. The method involves exposing cells to a chemical agent to be tested for anti-neoplastic activity, determining a change in

expression of at least one gene (I) of a signature gene set, where (I) comprises a sequence (S) selected from 8447 sequences (given in ABL61664 to ABL70110), or is at least 55% identical to (S), where a change in a expression is indicative of anti-neoplastic activity. (I) has cytostatic activity and can be used in gene therapy. MI can be used for screening an anti-neoplastic agent, and can be used for producing a product which can the data collected with respect to the anti-neoplastic agent as a result of MI, and the data is sufficient to convey the chemical structure and/or properties of the agent. MI can be used in the tractment of cancer such as colon, breast, stomach, lung, thyroid, cosophageal, ovarian, kidney, prostate or pancreatic cancer, adenocarcinoma, carcinoma, clear cell cancer, infiltrating ductal cancer, infiltrating ductal cancer, squamous cell carcinoma, neuroendocrine cancer, squamous call carcinoma, neuroendocrine and Wilm's tumour. 1612 rearcceerececarerreaarccccraaccecrecrreaasaaracresececas 1671 1552 AAGCGCAAGAGCCAGTCAAAGGTCCAGTCTAAGCCTGGCTCCTGCCCCATTATCT 1611 88 TGATTCGTTGCGCTATGTTAAACCCACCTAACCGTTGTTTGAAGGACACTGATTGTCCAG 147 0; Gaps 28 AIGCICAAGAACCAGITAAAGGICCIGIGICIAAAGCCAAGGITCIIGICCIAIIAICI 87 Diagnosos and treatment of cancer - using candidate tumor suppressor which utilizes a biotinylation-based subtraction procedure instead of hydroxyapatite as previously used. In this procedure, a single strand phagemid cDNA library from normal cell polyA+ mRNA is hybridized with excess biotinylated tumor polyA+ mRNA, and the resulting double stranded sequences are removed by binding to 1672 GAATCAAGAAGIGCIGIGAAGGCTCTIGCGGAAIGGCCTGTTTCGTTCCCCAGTGA 1727 148 GTATCAAAAAGTGCTGTGAAGGTTCCTGCGGTATGGCTTGTTTCGTTCCACAATAA 203 An adaptation of the subtractive hybridization technique was used 59.8%; Score 123.2; DB 24; Length 2309; 81.2%; Pred. streptavidin. The remaining single-stranded phagemid cDNAs are converted to double-stranded form and used to transform bacterial host cells. The resulting subtracted cDNA library is differentially screemed with total cDNA from normal and tumor cells. This method produced some 20 additional cloned cDNAs. Also found by this method were several genes which, on the basis of the partial DNA sequences appear to be novel sequences not previously entered into GENBANK. The portion of the cDNAs so sequenced represents part of the coding region and/or part of the 3' untranslated region of each cDNA (see Q28749-58).
                                                                                                                                                                                                                                                                           142 AAGCGCAAGAGCCAGTCAAAGGTCCAGTCTCCACTAAGCCTGGCTCCTGCCCCATTATCT 201

                                                                                                                                                                                                                                                                                                                                                                                                         osteoporosis, Paget's disease, glomerulonephritis, scleroderma, malaria, bacterial infection, Alzhaimer's disease, hypertension and muscular dystrophy. The present sequence represents the DNA encoding the human secretory leukoprotease inhibitor used to create the fusion protein
                       is useful for inhibiting protease activity associated with a disorder such as emphysema, asthma, chronic obstructive pulmonary disease, cystic fibrosis, otitis media, otitis external or HIV infection, or for treating an individual suffering from or at risk for a disease or disorder involving unwanted protease activity. The proteins are useful for treating dermatological diseases such as atopic dermatitis, eczema and psoriasis, in inflammatory responses to viral infection, and for treating herpes infection, corneal or epidermal ulceration, chronic non-healing wounds, sepsis, rheumatoid arthritis, periodontal disease, tumour metastasis and tumour angiquenesis, gastric ulceration,
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                        AAGCCAGGTTCTTGTCCTATTATCTTGATTCGTTGCGCTATGTTAAACCCACCTAACCGT 122

tumour metastasis and tumour angiogenesis, gastric ulceration, osteoporosis, Paget's disease, glomerulonephritis, scleroderma, malaria, bacterial infection, Alzheimer's disease, hypertension and muscular dystrophy. The present sequence represents the DNA encoding the
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                Into the control relates to a lover that process in the functionally protease inhibitor comprising an alphal-antitypesh or its functionally active portion and a second protease inhibitor or its functionally active protein. The fusion proteins of the invention may act as an inhibitor of protease activity. The fusion protein of the invention is useful for inhibiting protease activity associated with a disorder such as emphysema, asthma, chronic obstructive pulmonary disease, cystic fibrosis, otitis media, otitis external or HIV infection, or for treating an individual suffering from or at risk for a disease or disorder involving unwanted protease activity. The proteins are useful for treating dermatological diseases such as atopic dermatitis, eczema and psoriaais, in inflammatory responses to viral infection, and for treating herpes infection, corneal or epidermal ulceration, and for treating herpes infection, corneal or epidermal ulceration, and for treating herpes infection, corneal or epidermal ulceration, and for treating herpes infection, corneal or epidermal ulceration, and for the activity is activity.
                                                                                                                                                                                                                                                                                                                                                            Novel fusion protein useful for inhibiting protease activity associated with a disorder such as emphysema, asthma, comprises a first protease inhibitor comprising alpha 1-antitrypsin and a second protease
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                     non-healing wounds, sepsis, rheumatoid arthritis, periodontal disease,

Pemberton P; Barr PJ, Gibson HL,

WPI; 2002-500631/53. P-PSDB; AAU99884 Novel fusion protein useful for inhibiting protease activity associated with a disorder such as emphysema, asthma, comprises a first protease inhibitor comprising alpha 1-antitrypsin and a second protease nhibitor

Example 3; Page 89-90; 134pp; English.

This invention relates to a novel fusion protein comprising a first protease inhibitor comprising an alphal-antitrypsin or its functionally active portion and a second protease inhibitor or its functionally active protein. The fusion proteins of the invention may act as an inhibitor of protease activity. The fusion protein of the invention is useful for inhibiting protease activity by associated with a disorder cyclic fibrosis, others, asthma, chronic obstructive pulmonary disease, cystic fibrosis, ottis media, ottis external or HIV infection, or for treating an individual suffering from or at risk for a disease or disorder involving unwanted protease activity. The proteins are useful for treating dermatological diseases such as atopic dermatitis, eczena and psoriasis, in inflammantory responses to viral infection, and for treating herpes infection, corneal or epidermal ulceration, chronic non-healing wounds, sepsis, rheumatoid arthritis, periodonial disease, tumour metastasis and tumour angiogenesis, gastric ulceration, alaria, bacterial infection, Alzheimer's disease, hypertension and muscular dystrophy. The presents sequence represents the DNA encoding the 'SLAP1 fusion protein of the invention.

protease-mediated condition or tissue destruction e.g. emphysema or tumor invasion and for recombinant production of inhibitors New serine protease inhibitors and DNA sequences for treating a

Disclosure; Column 12-13; 47pp; English.

This invention relates to new purified and isolated mammalian serine procease inhibitors proteins which comprise at least 8 cysteine residues and no more than 107 amino acids. The procease inhibitors are capable of inhibiting chymotrypain and elastase. Sequences AAC97526 - AAC97534. AAC97581 and AAC97614 - AAC97641 represent DNA encoding the protease inhibitors of the invention, and include oligonucleotide sequences used in the isolation and characterisation of the proteins. Primers AAC97535 - AAC97573 and AAC95582 - AAC97613 are used in the construction of DNA encoding the protease inhibitors. Peptide sequences AAB53122 represent the protease inhibitors of the invention and various other peptides used in the isolation of the protease inhibitors. The protease inhibitors have cytostatic and anti-inflammancry activity. The scrime protease inhibitor protein is useful for treating a protease-mediated condition, which includes protease mediated tissue

          periodontitis, muscular dystrophy or tumour invasion. It is also useful for modulating protease activity. The DNAs are useful for producing the proteins, especially by recombinant methods.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                   Elastase-inhibiting peptide of low serine protease-inhibiting activity contains C-terminal portion of human polymorphonuclear leukocyte

ABB7893 to ABB79004 represent proteins encoded by the ABQ6078 to ABG60787 nucleic acid sequences. (1) can be used in antisense therapy. An antibody immunoreactive with a polypeptide encoded by (1) is useful for detecting cancer in a patient sample, and for detecting the presence or absence of a polymocleotide encoded by a nucleic acid which hybridises to (1) in a cell. A probe/primer derived from (1) can be used for determining the presence of a nucleic acid which hybridises to (1), and for determining the phenotype of cells in a sample
                                                              The sequence encodes a fragment of human polymorphonuclear leukocyte elastase inhibiting protein (Asn 55-Ala 107). See AAP90126 for encoded peptide. Misc. features a-g are BamHI, SalI, MluI, NdeI, BglII, XhoI and PstI sites resp. See also AAP90384.

reference level

The present invention describes a method (M1) for determining the difference between levels of expression of a number of genes characteristic of rheumatoid arthritis (RA) in cell and reference levels of expression of the genes, comprising: (a) providing RNA from a cell; (b) determining levels of RNA of a number of genes (G) characteristic of RA including a number of genes selected from SOCS3 (CISH3), RAGE (AGER), LST-1 (LY117), serum amyloid (SAA) 1-3, hydroxymethyl glutarate (HMG)-1, S100 A8, A9, and A12, secretory leukocyte protease inhibitor (SLPI); glucocorticoid leucine zipper (GLLZ), PTPN-18, GADD-45A and B, Legumain (PRSC1), follistatin-like 1 (FST1), lipocalin 2 (Lon2), glucose

to obtain the levels of expression of the genes in the cell; and col comparing the levels of expression of the genes in the cell; and set of reference levels of expression of the genes, to determine the difference between levels of expression of the number of genes characteristic of RA in the cell and reference levels of expression of the genes. Wa is useful for determining whether a subject has or is likely to develop RA, or for determining whether a subject has or is effective in a subject having RA who is receiving the therapy. Mais effective in a subject having the stage of RA in a subject, for determining the stage of RA in a subject having RA, and for determining the likelihood of success of a particular therapy in subject having RA. The present sequence represents a mutine SLDI sense riboprobe, which is used in an example from the present invention.
phosphate isomerase (GPI), serine protease inhibitor (SpiL), and TSG-6

Determining difference between expression levels of genes characteristic of ineumatoid arthritis in cell and reference level, by comparing expression levels of the genes determined in a cell with reference level -

Example 3; Page 88; 296pp; English

```
The present invention describes a method (MI) for determining the difference between levels of expression of a number of genes characteristic of expression of the genes, comprising: (A) in cell and reference levels of expression of the genes, comprising: (A) in cell and reference levels of expression of the genes, comprising: (A) providing RNA from a cell; (CAER), LST-1 (LY117), serum amyloid (SAA) 1-3, hydroxymethyl glutarate (HMG)-1, S100 A8, A9, and A12, secretory leukocyte protease inhibitor (SID); glucocorticoid leucine zipper (GILZ), prPN-18, GADD-45A and B, legumain (PRSC1), follistatin-like 1 (FST1), lipocalin 2 (LGC2), glucose phosphate isomerase (GPI), serine protease inhibitor (SpiL), and TSG-6 (C) comparing the levels of expression of the genes in the cell to a set of reference levels of expression of the genes in the cell to a set of reference levels of expression of the mumber of genes characteristic of RA in the cell and reference levels of expression of the genes, to determine the difference between levels of expression of the mumber of genes characteristic of RA in the cell and reference levels of expression of the genes, to determine the defective in a subject having RA who is receiving the therapy. MI is also useful for determining whether a subject has or is also useful for determining the efficacy of a therapy in a subject, for determining the efficacy of a therapy in a subject, for determining the likelihood of success of a particular therapy in subject having RA. The present sequence represents a murine SLDI antisense riboprobe, which is used in an example from the present invention.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                     111 CCACCTAACCGTTGTTTGAAGGACACTGATTGTCCAGGTATCAAAAAGTGCTGTGAAGGT 170

The present invention provides gene sequences associated with cancer metastasis which are isolated from mouse IMC carcinoma cells by detection of their higher expression in IMC-HM cell lines than in IMC-LM cell lines than in these cells. The gene sequences can be used for the screening of potential inhibitors of cancer metastasis by either: bringing into contact with the cancer metastasis associated protein (CMAP) and determining the degree of binding; or creating a transformant cell line which expresses CMAP and measuring the degree of expression of CMAP using an antibody recognising the protein, either in the presence or absence of the potential inhibitor. IMC-HM cells transformed with antisense CMAP DNA show a lowered ability to metastasise. The present sequence represents a specifically claimed gene sequence from the present invention.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                51 CCTGTGTCTACTAAGCCAGGTTCTTGTCCTATTATCTTGATTCGTTGCGCTATGTTAAAC 110

                                                                                                                                                                                                                                                                                                                                 The present invention provides gene sequences associated with cancer metastasis which are isolated from mouse IMC carcinoma cells by detection of their higher expression in IMC-HM cell lines than in IMC-LM cell lines than in IMC-LM cell lines using differential display of the mRNA in these cells. The gene sequences can be used for the screening of potential inhibitors of cancer metastasis by either: bringing into contact with the cancer metastasis associated protein (PMP) and determining the degree of binding; or creating a transformant cell line which expresses CMAP and measuring the degree of expression of CMAP using an antibody recognising
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                         51 CCTGTGTCTACTAAGCCAGGTTCTTGTCCTATTATCTTGATTCGTTGCGCTATGTTAAAC 110

The present invention provides gene sequences associated with cancer metastasis which are isolated from mouse IMC carcinoma cells by detection of their higher expression in IMC-HM cell lines than IMC-LM cell lines using differential display of the mRNA in these cells. The gene sequences can be used for the screening of potential inhibitors of cancer metastasis by either: bringing into contact with the cancer metastasis associated protein (CMAP) and determining the degree of binding; or creating a transformant cell line which expresses CMAP and measuring the degree of expression of CMAP using an antibody recognising
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                Human; cytokine; cell proliferation; cell differentiation; gene therapy;

                                                                                                                                                                                                                                                                          ö
                               The invention relates to human polynucleotides (AAI79941-AAI93841) and the encoded proteins (AA000010-AA013910) that exhibit activity elating to cytokine, cell proliferation or cell differentiation or which may induce production of other cytokines in other cell populations. The polyneptides are useful in gene therapy, vaccines or peptide therapy. The polypeptides have various cytokine-like activities, e.g. stem cell growth factor activity, haematopoiesis regulating activity, tissue growth factor activity, immunomodulatory activity and activin/inhibin activity and may be useful in the diagnosis and/or treatment of cancer, leukaemia, nervous system disorders, arthritis and
                                                                                                                                                                         Note: The sequence data for this patent did not form part of the printed specification, but was obtained in electronic format directly from WIPO

The DNA sequences and tecombinant methods allow manufacture of a class of inhibitors of e.g. catheppsin G, elastase, and trypsin, with different specificities. The recombinant serine protease product can be directed to act intracellularly or extracellularly and is useful in treating conditions caused by a disturbance in the native protease/protease inhibitor balance such as emphysema, arthritis, glomerulonephritis, peridontitis, muscular dystrophy, tumour invasion, sepsis, and acute leukemia. (A) purities so as to provide economical pharmaceutical compositions. (B) to be recombinantly produced in sufficient quantities and purities so as to provide economical pharmaceutical compositions. (B) is tresistant to heat, acid, and a variety of proteolytic enzymes, is thermodynamically stable in extracellular conditions, and exhibits a
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                   The present invention describes a DNA sequence (A) encoding an analogue

The DNA sequences and recombinant methods allow manufacture of a class of inhibitors of e.g. cathepsin G, elastase, and trypsin, with different specificities. The recombinant serine protease product can be directed to act intracellularly or extracellularly and is useful in treating conditions
         absence of biochemical stimuli. The present sequence represents a DNA sequence which is used to direct manufacture of recombinant serine protease inhibitors.

                                                 allows (B) to be recombinantly produced in sufficient quantities and purities so as to provide economical pharmaceutical compositions. (B) is resistant to heat, acid, and a variety of proteolytic enzymes, is thermodynamically stable in extracellular conditions, and exhibits a high degree of self assembly forming an active terriary structure in the absence of biochemical stimil. The present sequence represents a DNA sequence which is used to direct manufacture of recombinant serine
caused by a disturbance in the native protease/protease inhibitor balance such as emphysema, arthritis, glomerulonephritis, peridontitis, muscular dystrophy, tumour invasion, sepsis, and acute leukemia. (A)
